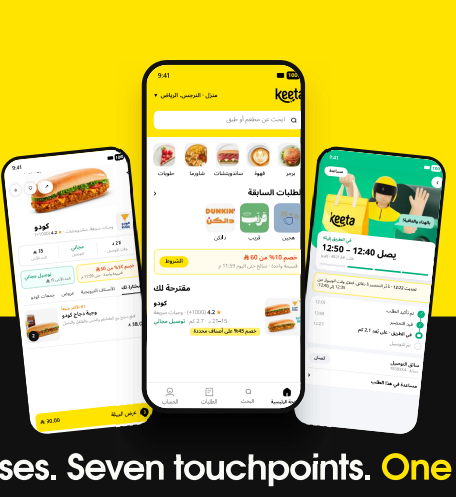
Independent UX/UI Concept · Not Affiliated with Keeta.

From Clutter to Clarity.

Redesigning the Keeta food ordering experience

A four-phase redesign of Keeta's Arabic mobile app, from finding a restaurant to resolving a missing item. I led the research, product thinking, information architecture, and interaction and UI design, grounded in a screenshot audit, public user feedback and openly stated assumptions.



Four phases. Seven touchpoints. One journey.

Discovery → Search → Offers → Menu → Checkout → Tracking → Support

01 Discover
Screenshot audit, public reviews, competitors, affinity and journey.

02 Define
Problem framing, proto-persona, How Might We and requirements.

03 Ideate
Information architecture, flows, concepts and wireframes.

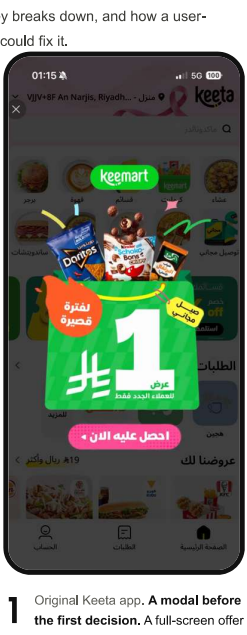
04 Design
Design system, nine screens and before-and-after comparisons.

The challenge

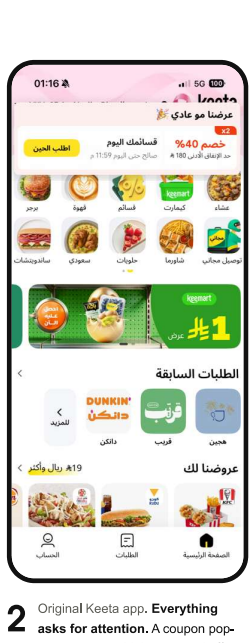
“I found the interface visually overwhelming, cluttered and uncomfortable to navigate.”

It started with my own lunch orders. Promotional banners, crowded restaurant listings and an inconsistent visual hierarchy made a simple order feel like work.

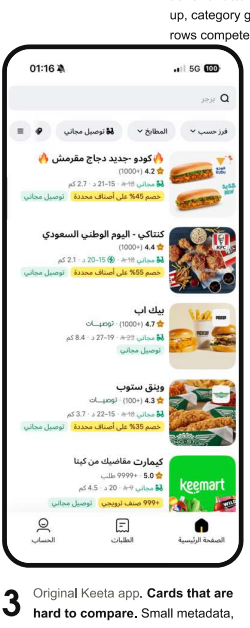
Instead of only restyling the app, I set out to understand the problems behind the experience: whether other users reported the same frustrations, where the journey breaks down, and how a user-centred process could fix it.



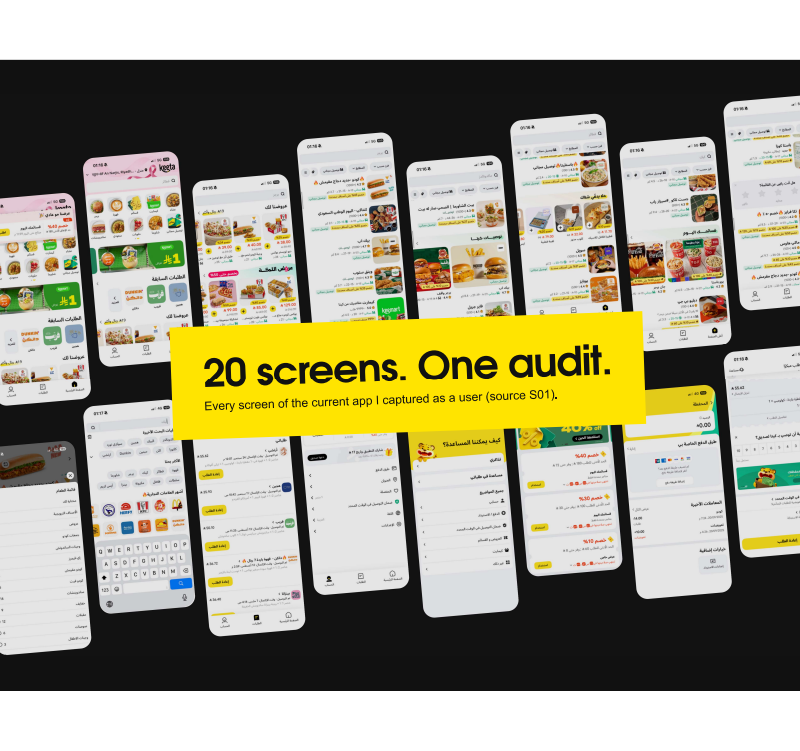
1 Original Keeta app. **A modal before the first decision.** A full-screen offer covers the app on launch, ahead of search or restaurants.



2 Original Keeta app. **Everything asks for attention.** A coupon pop-up, category grid, banner and offer rows compete on one home screen.



3 Original Keeta app. **Cards that are hard to compare.** Small metadata, stacked offer chips and fee labels make restaurants slow to scan.



20 screens. One audit.

Every screen of the current app I captured as a user (source S01).

How might we turn Keeta's visually overwhelming ordering experience into a clearer, more intuitive and trustworthy journey, while keeping its useful features?

- 01 Reduce unnecessary visual complexity
- 02 Improve content hierarchy and navigation
- 03 Make restaurant information easier to compare
- 04 Improve transparency around discounts and pricing
- 05 Communicate delivery expectations more clearly
- 06 Simplify getting help and resolving order issues

Phase 01

Discover

What the screens reveal, and what users report publicly.

These findings are preliminary and qualitative. They come from the 20 screenshots and from published user accounts, and they are not statistically representative.

4.7 App Store, Saudi Arabia

3.4 Google Play

Two stores, two very different scores.

Ratings at the time of research (S02, S03), shown for context only. The reviews behind them are qualitative evidence, not representative survey results.

What people report, in five themes

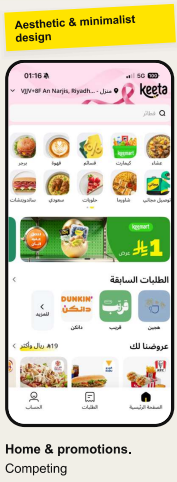
Drawn from App Store, Google Play and Reddit (S02–S05).

- R01 **Delivery expectations** Reported unexpectedly long delivery estimates after ordering.
- R02 **Customer support** Reports of handoffs and difficulty resolving incorrect or missing items.
- R03 **Offer confidence** Reported dissatisfaction with offer interpretation or conditions.
- R04 **Recovery & refunds** Public accounts describe unclear complaint or refund outcomes.
- R05 **Mixed sentiment** Positive comments about value coexist with negative service experiences.

The audit, screen by screen

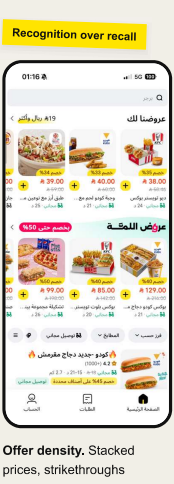
A screenshot-based evaluation of the original Keeta app through Nielsen's heuristics. The observations are mine, not task-performance data. The yellow notes name the heuristic each screen strains.

Aesthetic & minimalist design



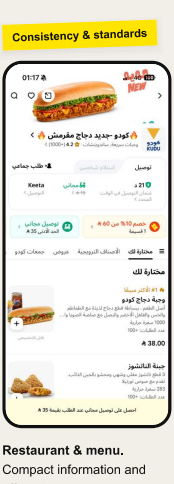
Home & promotions. Competing promotional blocks.

Recognition over recall



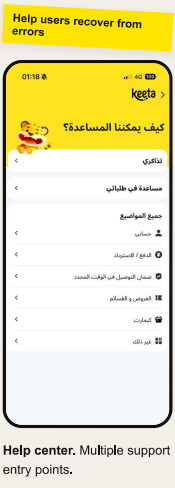
Offer density. Stacked prices, strikethroughs and badges.

Consistency & standards



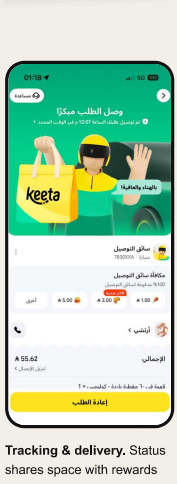
Restaurant & menu. Compact information and offer labels.

Help users recover from errors



Help center. Multiple support entry points.

Visibility of system status



Tracking & delivery. Status shares space with rewards and rating.

An initial, feature-level competitive scan

Keeta against HungerStation Jahez ToYou

Compared across discovery, offers, order tracking and support. The scan sets context for the redesign and makes no claims about competitors' performance.

Twelve observations, four themes

An affinity map combining screenshot observations with reported user experiences.

Visual overload
- Dense restaurant cards
- Multiple competing banners
- Small information labels

Decision clarity
- Offer conditions
- Final-price comprehension
- Restaurant comparison

Delivery confidence
- ETA expectations
- Tracking clarity
- Order status updates

Service recovery
- Missing-item reporting
- Support continuity
- Refund visibility

Friction, from first tap to after delivery

The current journey as a hypothesis map, built from the available screens and reviews rather than observed task performance.

Discover	Compare	Checkout	Track	Support
Goal: find a place	Goal: choose well	Goal: know the total	Goal: know when	Goal: resolve issues
Friction Crowded offers	**Friction** Dense cards	**Friction** Offer complexity	**Friction** ETA uncertainty	**Friction** Unclear outcomes
Opportunity Clear entry point	**Opportunity** Scannable options	**Opportunity** Price breakdown	**Opportunity** Visible timeline	**Opportunity** Case status

Clarity has to support the whole lifecycle, from discovery and decision-making to recovery when something goes wrong.
Research conclusion

How might Keeta make discovery, price decisions, delivery updates and support more understandable with less cognitive effort?

Priority levels are expert judgements, not complaint frequencies or measured severity.

- **P1** Simplify discovery — Reduce competing visual emphasis on the home screen.
- **P1** Clarify offers & totals — Surface eligibility, exclusions and final price earlier.
- **P1** Improve restaurant browsing — Standardize cards and comparison cues.
- **P2** Strengthen tracking clarity — Communicate delivery stages and changes.
- **P2** Redesign support recovery — Guide issue reporting and show case status.

Sources
S01, the 20 Keeta screenshots I captured (direct visual evidence). S02, Apple App Store, Keeta (SA). S03, Google Play, Keeta. S04, Reddit, r/saudiarabia. S05, Reddit, r/Jeddah.

Limitations
Public reviews are self-selected, may reflect other versions or regions, and have not been independently verified. No original X posts, interviews, task-success rates or measured improvements are claimed. The competitor comparison stays at feature level.

Define

Phase 02: turning evidence into direction

Users trying to order efficiently may struggle to prioritize relevant restaurants amid dense promotional content, understand offer eligibility and total cost, and feel confident about delivery updates or issue resolution.

Every output in this phase is a working hypothesis, not a validated interview finding. Scope covers the ordering journey plus post-order support; logistics and backend are out of scope.

“How do I find the right restaurant without scanning so much?” Discovery

“Will this discount apply, and what will I actually pay?” Decision

“If something goes wrong, what happens next?” Recovery

A research-informed proto-persona. It is an assumption-based design tool, not derived from interviews.

The time-pressed food orderer

A mobile user choosing lunch between classes or work tasks, comparing options and expecting clear pricing and timing.

Goals
Find a suitable restaurant quickly; understand the final price; place an order confidently.

Frictions
Competing banners, compact offer labels, unclear delivery expectations and uncertain support outcomes.

Needs
Relevant discovery, legible comparisons, transparent terms and an accessible issue-resolution path.

Behaviours are hypothesized from the app context and public feedback. Demographic attributes are deliberately not invented.

Five needs, five How Might We questions

Focus. See useful restaurants before optional promotions.	How might we prioritize relevant choices without hiding value?
Compare. Compare price, ETA, rating and fees at a glance.	How might we make restaurant cards faster to scan?
Understand. Know whether a promotion applies before checkout.	How might we explain eligibility at the moment of choice?
Trust. Understand order stages and changes.	How might we make delivery status easy to interpret?
Recover. Report issues and track a case without restarting.	How might we make support feel continuous and accountable?

Each friction gets a design response

Open the app	Choose a restaurant	Apply offers	Wait for delivery	Report an issue
~~Promotions dominate~~	~~Dense metadata~~	~~Conditions unclear~~	~~ETA may change~~	~~Unclear next step~~
Relevant first screen	**Clear comparison**	**Visible price math**	**Status timeline**	**Case tracker**

The moments of truth: selecting an offer, confirming payment, interpreting a delay and filing an issue.

The spec for the final UI

Six essentials (P0) and two extras if time permits (P1).

P0	Discovery	Primary search and relevant restaurant content visible without a disruptive modal.
P0	Restaurant cards	Consistent hierarchy: name, ETA, rating, delivery cost and eligible offer.
P0	Promotions	Show eligibility, minimum spend and exclusions before applying a coupon.
P0	Checkout	Show item subtotal, fees, discounts and final payable amount.
P0	Tracking	Show order stage, current ETA and a clear path to help.
P0	Support	Choose order, choose issue, submit evidence and view case status.
P1	Recovery	Allow return to an in-progress support case.
P1	Accessibility	RTL reading order, readable type, clear labels and touch targets.

How success could be measured

These are proposed metrics for future testing, not achieved results. No completion rates, satisfaction improvements, user counts or statistical effects are claimed.

- **Task completion** Find and select a restaurant with the desired constraints.
- **Time on task** Time to find a suitable option and identify the final total.
- **Price comprehension** Can users correctly explain fees, discounts and payable total?
- **Offer comprehension** Can users identify coupon eligibility before placing an order?
- **Support completion** Can users submit a missing-item report and find its status?
- **Perceived clarity** Post-task confidence and ease ratings.

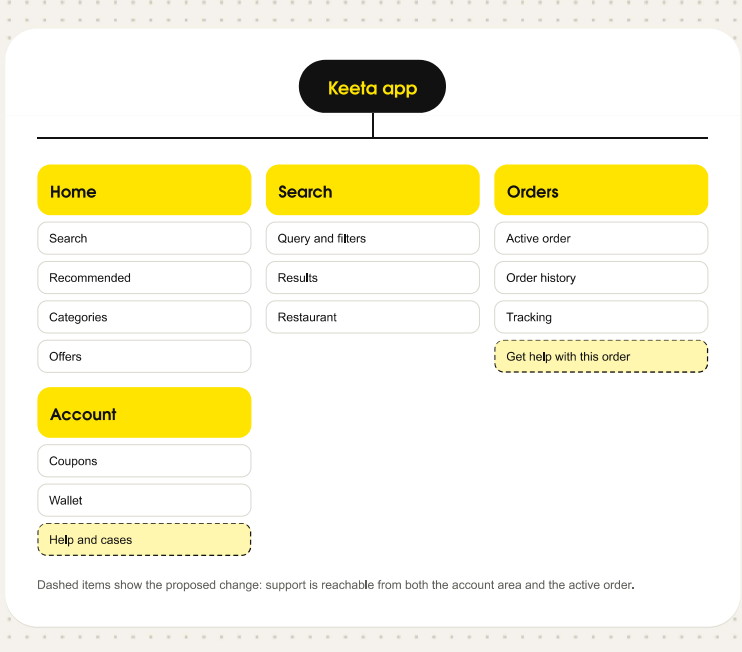
Phase 03

Ideate?

From problems to possibilities: structure first, pixels later.

Four tabs, less duplication

The proposed information architecture removes duplicated navigation and keeps discovery, order status and support within easy reach.



Dashed items show the proposed change: support is reachable from both the account area and the active order.

Two journeys: ordering and recovery

Flow A, discover to checkout The happy path, with transparent promotions and pricing

1. **Start** Open Home; find primary search or recommendations.
2. **Filter** Set cuisine, ETA, budget or delivery preference.
3. **Compare** Scan consistent cards and select a restaurant.
4. **Choose** Browse the menu and add items.
5. **Review** View cart, fees, discounts and eligibility.
6. **Confirm** Confirm address, ETA and total.
7. **Place order** Submit the order.
8. **Track** View status and the support entry point.

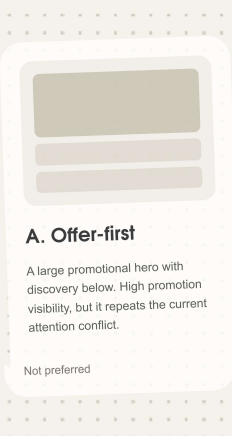
Decision point at step 5. If a coupon is ineligible, explain why and show the unchanged total. It should never be silently removed.

Flow B, tracking to support Recovery for a missing or incorrect item, grounded in public complaint themes

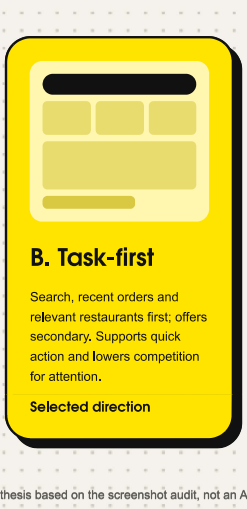
1. **Order** Open an active or previous order.
2. **Help** Choose “Get help with this order”.
3. **Issue type** Select missing, incorrect, delayed or other.
4. **Details** Select affected items; add optional evidence.
5. **Review** Review the issue summary and submit.
6. **Case ID** Show case status and next steps.
7. **Follow up** Return to the case without repeating context.
8. **Outcome** Show the resolution or an appeal pathway.

Service promises, refund timing and policy decisions are conceptual; no operational guarantees are implied.

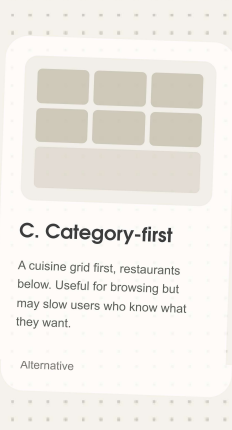
Three home structures, one direction



A. Offer-first
A large promotional hero with discovery below. High promotion visibility, but it repeats the current attention conflict.
Not preferred



B. Task-first
Search, recent orders and relevant restaurants first; offers secondary. Supports quick action and lowers competition for attention.
Selected direction



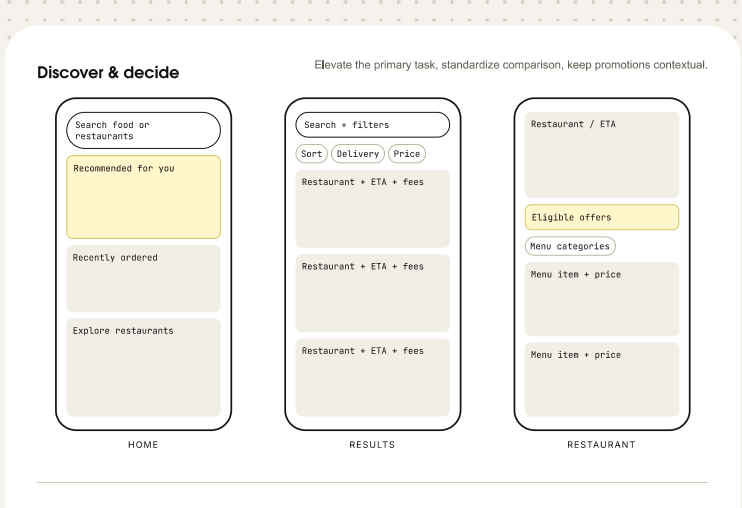
C. Category-first
A cuisine grid first, restaurants below. Useful for browsing but may slow users who know what they want.
Alternative

The recommendation is an expert design hypothesis based on the screenshot audit, not an A/B test or measured user preference.

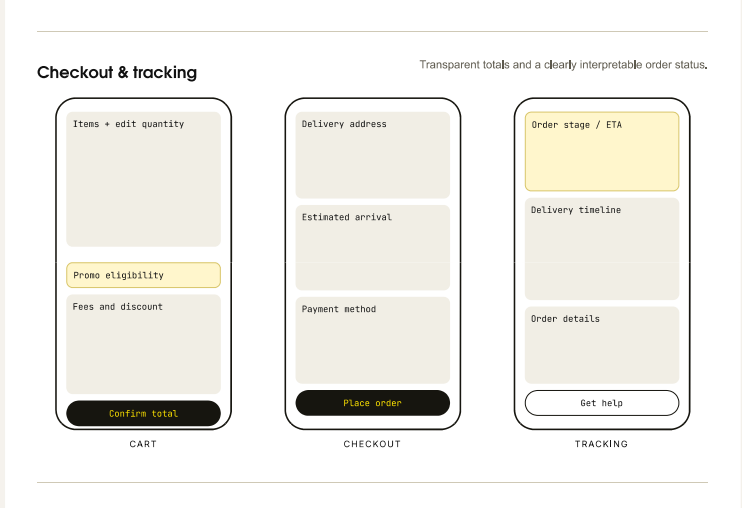
Nine structures, ready for UI

Low-fidelity wireframes with structural blocks only. Spacing, typography and visual identity were left to Phase 04.

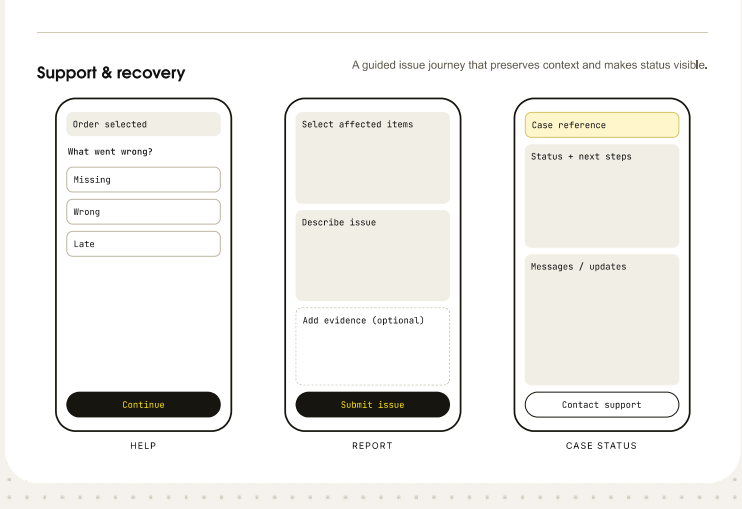
Discover & decide Elevate the primary task, standardize comparison, keep promotions contextual.



Checkout & tracking Transparent totals and a clearly interpretable order status.



Support & recovery A guided issue journey that preserves context and makes status visible.

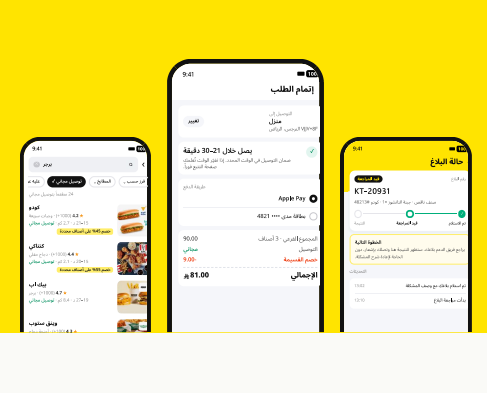


Original screenshot → Identified friction → Low-fi concept → Final UI

Phase 04

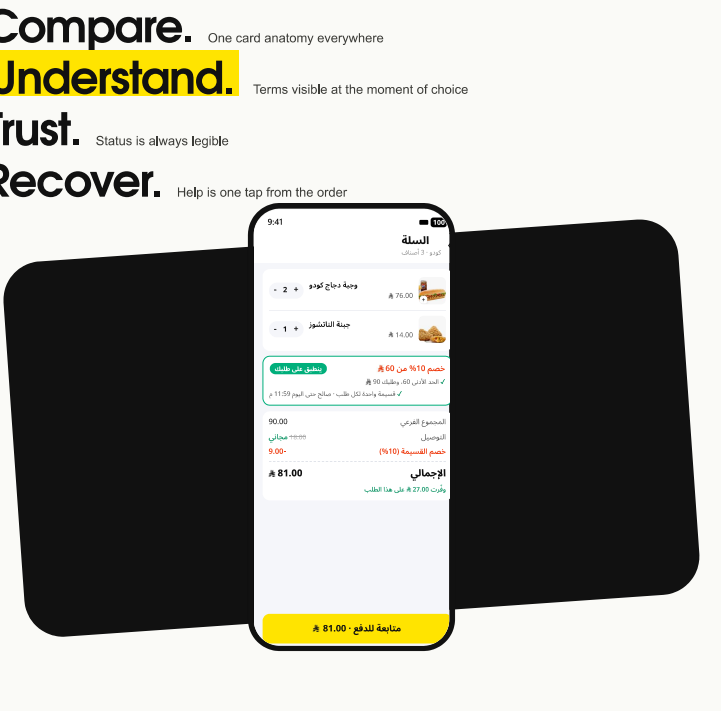
Design

Recognisably Keeta, with room to breathe. A proposed redesign by Norah.



Five principles carried over from Define guided every screen.

Focus. Task before promotion
Compare. One card anatomy everywhere
Understand. Terms visible at the moment of choice
Trust. Status is always legible
Recover. Help is one tap from the order



What I kept

Keeta's exact yellow, green and offer red, the system Arabic type, the logo, mascot, icons and riyal symbol, all sampled from the original screens.

What I changed

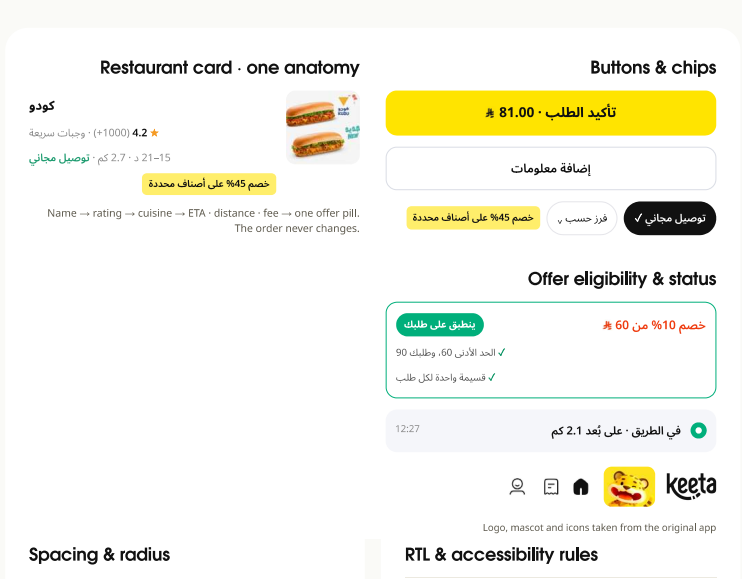
Yellow is reserved for the main action and the active state. Neutral surfaces carry everything else, and every price is spelled out.

A design system built from the original app

#FFE400 #111111

Typography
SF Arabic (system) · Noto Sans Arabic fallback
أب
Screen title · 22–26 · Heavy عنوان الشاشة
Section · 19 · Bold عنوان القسم
Body · 14–16 · Regular نص أساسي للمحتوى
Meta · 12–13 · Regular نص مساعد وتوضيح

Colour
Keeta Yellow #FFE400 · brand, primary action
Ink #111111 · text
Canvas #F5F5F4
Offer red #EF3C10
Offer pill #FFEE8E
Keeta green #00AF78
Green tint #E2F5EF
Field #EFF0F4



Name → rating → cuisine → ETA · distance · fee → one offer pill. The order never changes.

Logo, mascot and icons taken from the original app

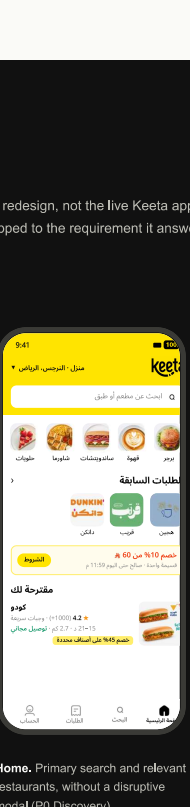
Spacing & radius
4 8 12 16 20 24 32
12 · chip 16 · card 28 · sheet pill
20px screen margin · 4-point grid

RTL & accessibility rules
- 01 Layout mirrors fully; the back arrow points right.
- 02 Prices, times and codes keep left-to-right digits.
- 03 Touch targets are at least 44 px; the main action is 54–58 px.
- 04 Status is never shown by colour alone; a ✓ or • always comes with text.

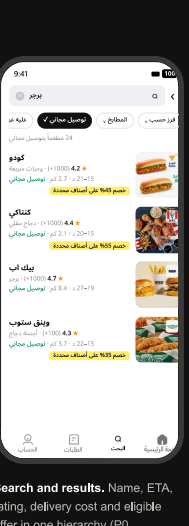
Nine screens, three flows

My proposed redesign, not the live Keeta app. Each screen is mapped to the requirement it answers.

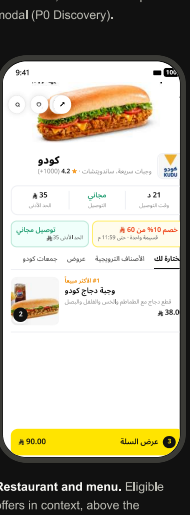
A Discover and decide



Home. Primary search and relevant restaurants, without a disruptive modal (P0 Discovery).

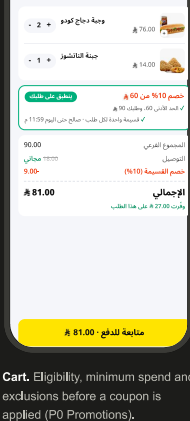


Search and results. Name, ETA, rating, delivery cost and eligible offer in one hierarchy (P0 Restaurant cards).

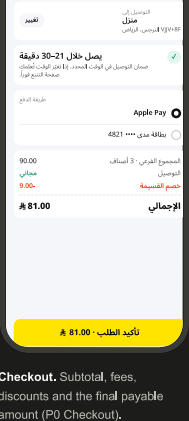


Restaurant and menu. Eligible offers in context, above the menu categories.

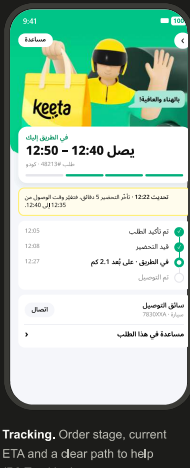
A Checkout and tracking



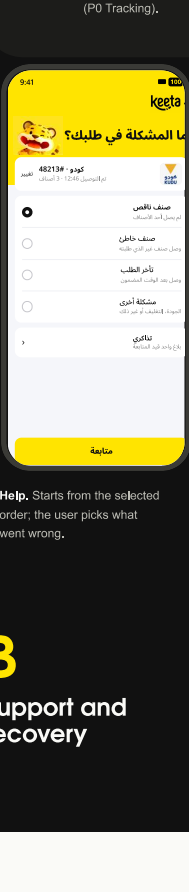
Cart. Eligibility, minimum spend and exclusions before a coupon is applied (P0 Promotions).



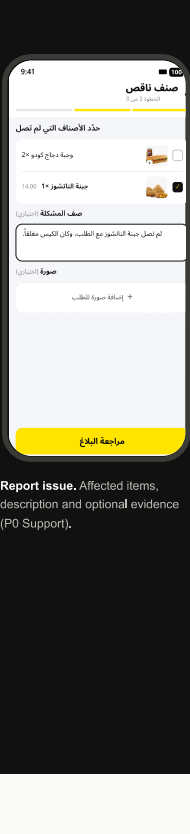
Checkout. Subtotal, fees, discounts and the final payable amount (P0 Checkout).



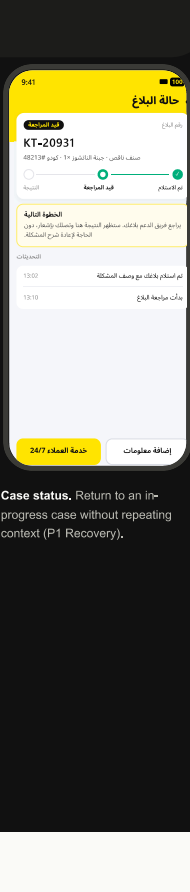
Tracking. Order stage, current ETA and a clear path to help (P0 Tracking).



Help. Starts from the selected order; the user picks what went wrong.



Report issue. Affected items, description and optional evidence (P0 Support).



Case status. Return to an in-progress case without repeating context (P1 Recovery).

B Support and recovery

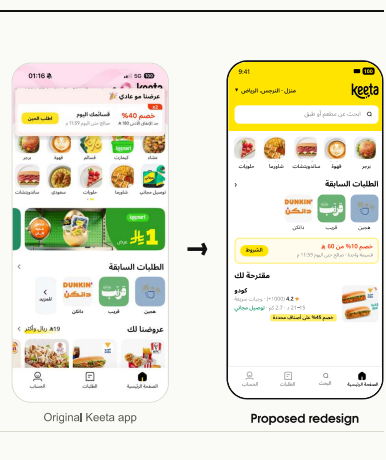
Clutter → Clarity

Six pairs, each linking an original screen to the redesign and the issue it targets. They show design intent; no measured improvement is claimed.

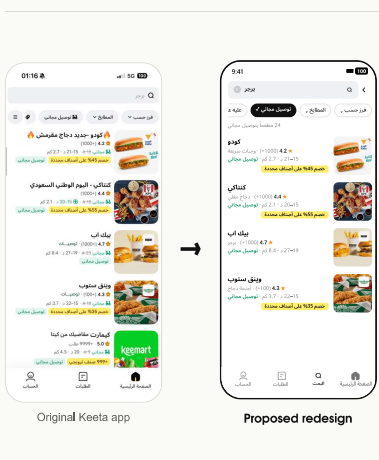
01 Home

Visual overload

Addresses competing banners and the launch modal. Search and recommendations come first; offers become secondary.



Original Keeta app → Proposed redesign



Original Keeta app → Proposed redesign

02 Restaurant list

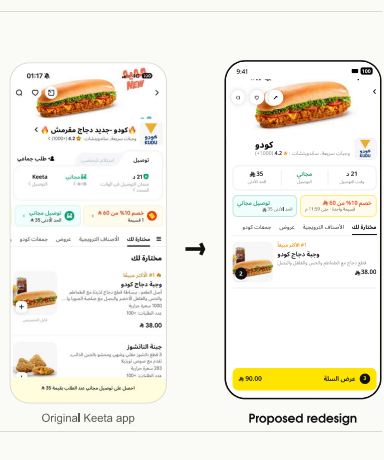
Decision clarity

Addresses dense, inconsistent cards. One card anatomy makes ETA, rating, fees and offers comparable at a glance.

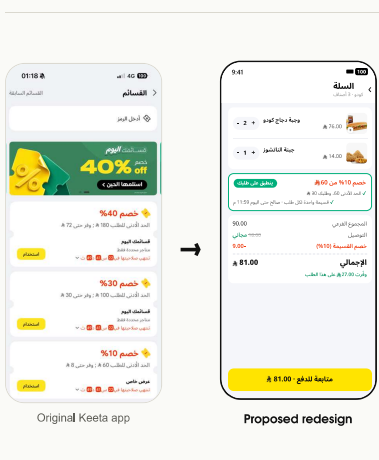
03 Restaurant and menu

Visual overload

Addresses compact information and scattered offer labels. Eligible offers are grouped once, above the menu.



Original Keeta app → Proposed redesign



Original Keeta app → Proposed redesign

04 Coupons into the cart

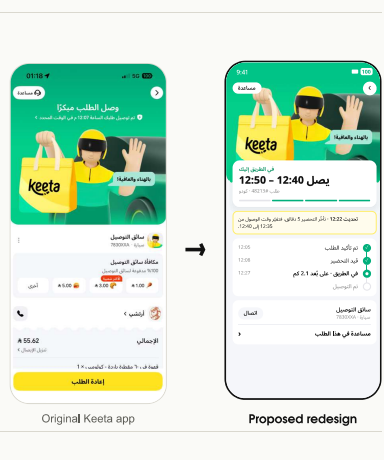
Decision clarity

Addresses offer conditions and final-price comprehension (R03). Eligibility and price math appear where the coupon is used.

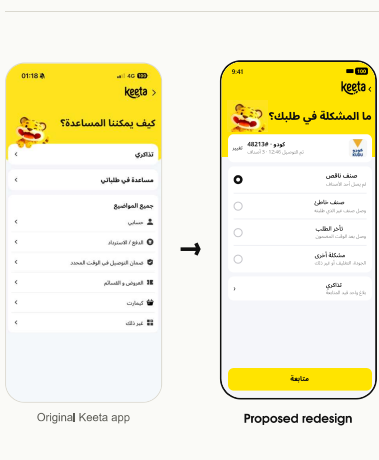
05 Order tracking

Delivery confidence

Addresses ETA uncertainty (R01). A status timeline gives stages and changes priority, with help one tap away.



Original Keeta app → Proposed redesign



Original Keeta app → Proposed redesign

06 Help center

Service recovery

Addresses handoffs and unclear outcomes (R02, R04). A guided report leads to a visible case status.

A better food ordering experience is not the one with more features, promotions or visual elements. It is the one that helps people find what they need, understand their choices and finish with confidence.

The hardest part

Working without direct user access meant every decision had to be traced to screenshots or public feedback. Promotions also had to stay valuable to the business while losing their dominance.

What I learned

Labelling evidence honestly, as observed, reported or assumed, made the design rationale stronger. Clarity problems often sit in hierarchy and wording rather than in missing features.

From research to design

Each final screen traces back through a requirement, a How Might We question and an affinity theme, so visual choices answer a defined problem.

Limitations

Research is preliminary: self-selected public reviews, a screenshot audit and an assumption-based persona. No interviews or usability tests were run.

What comes next

Test the prototype against the proposed metrics, validate the persona through interviews, and refine RTL behaviour and accessible states with real users.

Clarity.

Designed by Norah. Thank you for reading.

Disclaimer

This is an independent UX/UI concept redesign created by Norah for portfolio purposes. It is not an official Keeta project and is not affiliated with, sponsored or endorsed by Keeta or its parent company.

Keeta's name, logo, mascot, illustrations, colours and original interface are the property of their respective owners. Restaurant names, logos and food photography shown in the original screenshots belong to their owners; where they appear inside the redesigned screens, they are cropped from those screenshots and used for illustration only.

Screens labelled “Original Keeta app” are unedited screenshots captured by the author and used for analysis and commentary. Screens labelled “Proposed redesign” are the author's own concept work and do not represent the live product.

Research is preliminary and qualitative: a screenshot audit and self-selected public feedback. No interviews, usability tests, statistics or measured outcomes are claimed.
